

Parallel Processing

Technology Summary

This algorithm uses a divide-and-conquer strategy in a novel parallel algorithm to reduce the computational complexity of D2 clustering. The goal is to parallelize the centroid update in D2 clustering by: dividing the data into segments based on their adjacency, computing some local centroids for each segment in parallel, and combining the local centroids to a global centroid. This parallel algorithm achieves significant speed up with minor accuracy loss. The computational intensiveness of D2 clustering limits its usage to only relatively small scale problems.

Application & Market Utility

Scalability has emerged as a problem with D2 clustering because unknown variables grow with the number of objects in a cluster. As a result, it takes several minutes to learn each category by performing D2 clustering on 80 images, and takes days to complete the modeling of thousands of images. With emerging demands to extend the algorithm to large-scale datasets (online image datasets, video resources, biological databases) this invention exploits parallel processing in a cluster computing environment in order to overcome the inadequate scalability of D2 clustering.

Invent Penn State is a Commonwealth-wide initiative to spur economic development, job creation, and student career success. Invent Penn State blends entrepreneurship-focused academic programs, business startup training and incubation, funding for commercialization, and university-community collaborations to facilitate the challenging process of turning research discoveries into valuable products and services that can benefit Pennsylvanians and humankind. Learn more at invent.psu.edu.

Penn State is an equal opportunity, affirmative action employer, and is committed to providing employment opportunities to all qualified applicants without regard to race, color, religion, age, sex, sexual orientation, gender identity, national origin, disability or protected veteran status.
