Anti-microbial Molecule isolated from nonpathogenic E. coli

ID# 2019-4924

Shiga toxin inhibitis protein synthesis

Technology Summary

Using a proprietary assay, the researchers discovered extra-intestinal E. coli isolates (ExPEC) that carry multiple bacteriocins. Five (5) isolates were sequenced and amplified. Of which, the researchers discovered a non-pathogenic isolate that encodes the molecule responsible for increasing Stx2 production within other competitive, phage infected E. coli strains. The microcin specifically inhibits E. coli strains and those of a closely related species, Shigella.

Application & Market Utility

The invention's microcin may serve as a useful research tool for studying hemolytic uremic syndrome, including amplification of Stx. The commercial utility of this invention could also include its use as a pro-biotic composition, specially for cattle feed. The composition would kill the O157 pathogen by triggering bacteriophage-mediated killing (aka apoptosis).
